**We should develop more renewable energy for
the sustainability of our environment**

I agree that “We should develop more renewable energy for the sustainability of our environment”.

First, renewable energy creates less pollution to the environment. The burning of fossil fuels will pull out methane and carbon dioxide. Both of them are greenhouse gases. Taking fossil fuels needs to destroy the forest. So it may cause soil erosion and landslides as well.

Second, the sources of renewable energy is unlimited. Renewable energy includes wind power, hydroelectric power, biomass energy and so on. And all these have infinite supply. However, fossil fuel and nuclear power are limited.

Someone says that the cost of electricity generated by renewable energy is higher than non-renewable energy. But renewable energy is unlimited. And there are many ways to generate it such as wind power, hydroelectric power, biomass energy and so on. Fossil fuels and nuclear power burning process needs water to cool down. The water that discharged to sea is hot and it makes heat pollution and kill the sea animals.

I strongly believe that renewable energy should replace non-renewable energy in the future. So I agree “We should develop more renewable energy for the sustainability of our environment”.
