Should we develop more renewable energy?

Nowadays our world is facing many environmental problems like global warming, air pollution and so on. They are all caused by the burning of fossil fuels which release carbon dioxide and other pollutants into the air. So, we should develop more renewable energy for the sustainability of our environment.

According to the Friends of the Earth, non-renewable energy like fossil fuels can just be used for 50 years. We will not have energy to use if we only rely on fossil fuels. However, if we develop renewable energy, we can use it for many years. We do not have to worry about the energy problem.

To make matters worse, many people died due to air pollution. We use fossil fuels which release many pollutants into the air and they make many people sick. In serious cases, they may die as well. But renewable energy does not release pollutants and it is very clean. So we should develop renewable energy quickly.

Some may argue that renewable energy is very expensive, like solar panels may not be affordable to many people, but renewable energy can help the sustainability of our environment which in the long run, can save us lots of money. So the message is clear that developing renewable energy is essential to help our world. We should develop renewable energy without delay!
