The promotion of renewable energy

Recently, a lot of people have realized the risks the environment is facing because the government promote the use of renewable energy for sustainable development. I totally support it. There is no doubt that we should develop renewable energy for the sustainability of the environment.

First of all, renewable energy can reduce pollution so that our environment will be greener and cleaner as well as human life be healthier.

Secondly, the renewable energy, including solar power, wind power, hydro power and the like can be obtained easily from the environment. They will not be exhausted as well. What's more, they cost nothing at all.

Some may argue that energy-saving electrical appliances can solve the problem of high energy consumption. However, the fossil fuel takes millions of years to produce. No matter how much electricity we can save, we cannot wait for the next batch of fossil fuels to be formed.

To sum up, it is necessary to develop renewable energy as they would not be exhausted and it could reduce pollution. The most important is that it protects our environment. That's why we should develop renewable energy for the sustainability of the environment and for the sake of human kind.
