**Do we need to develop different renewable energy for
the sustainability of our environment?**

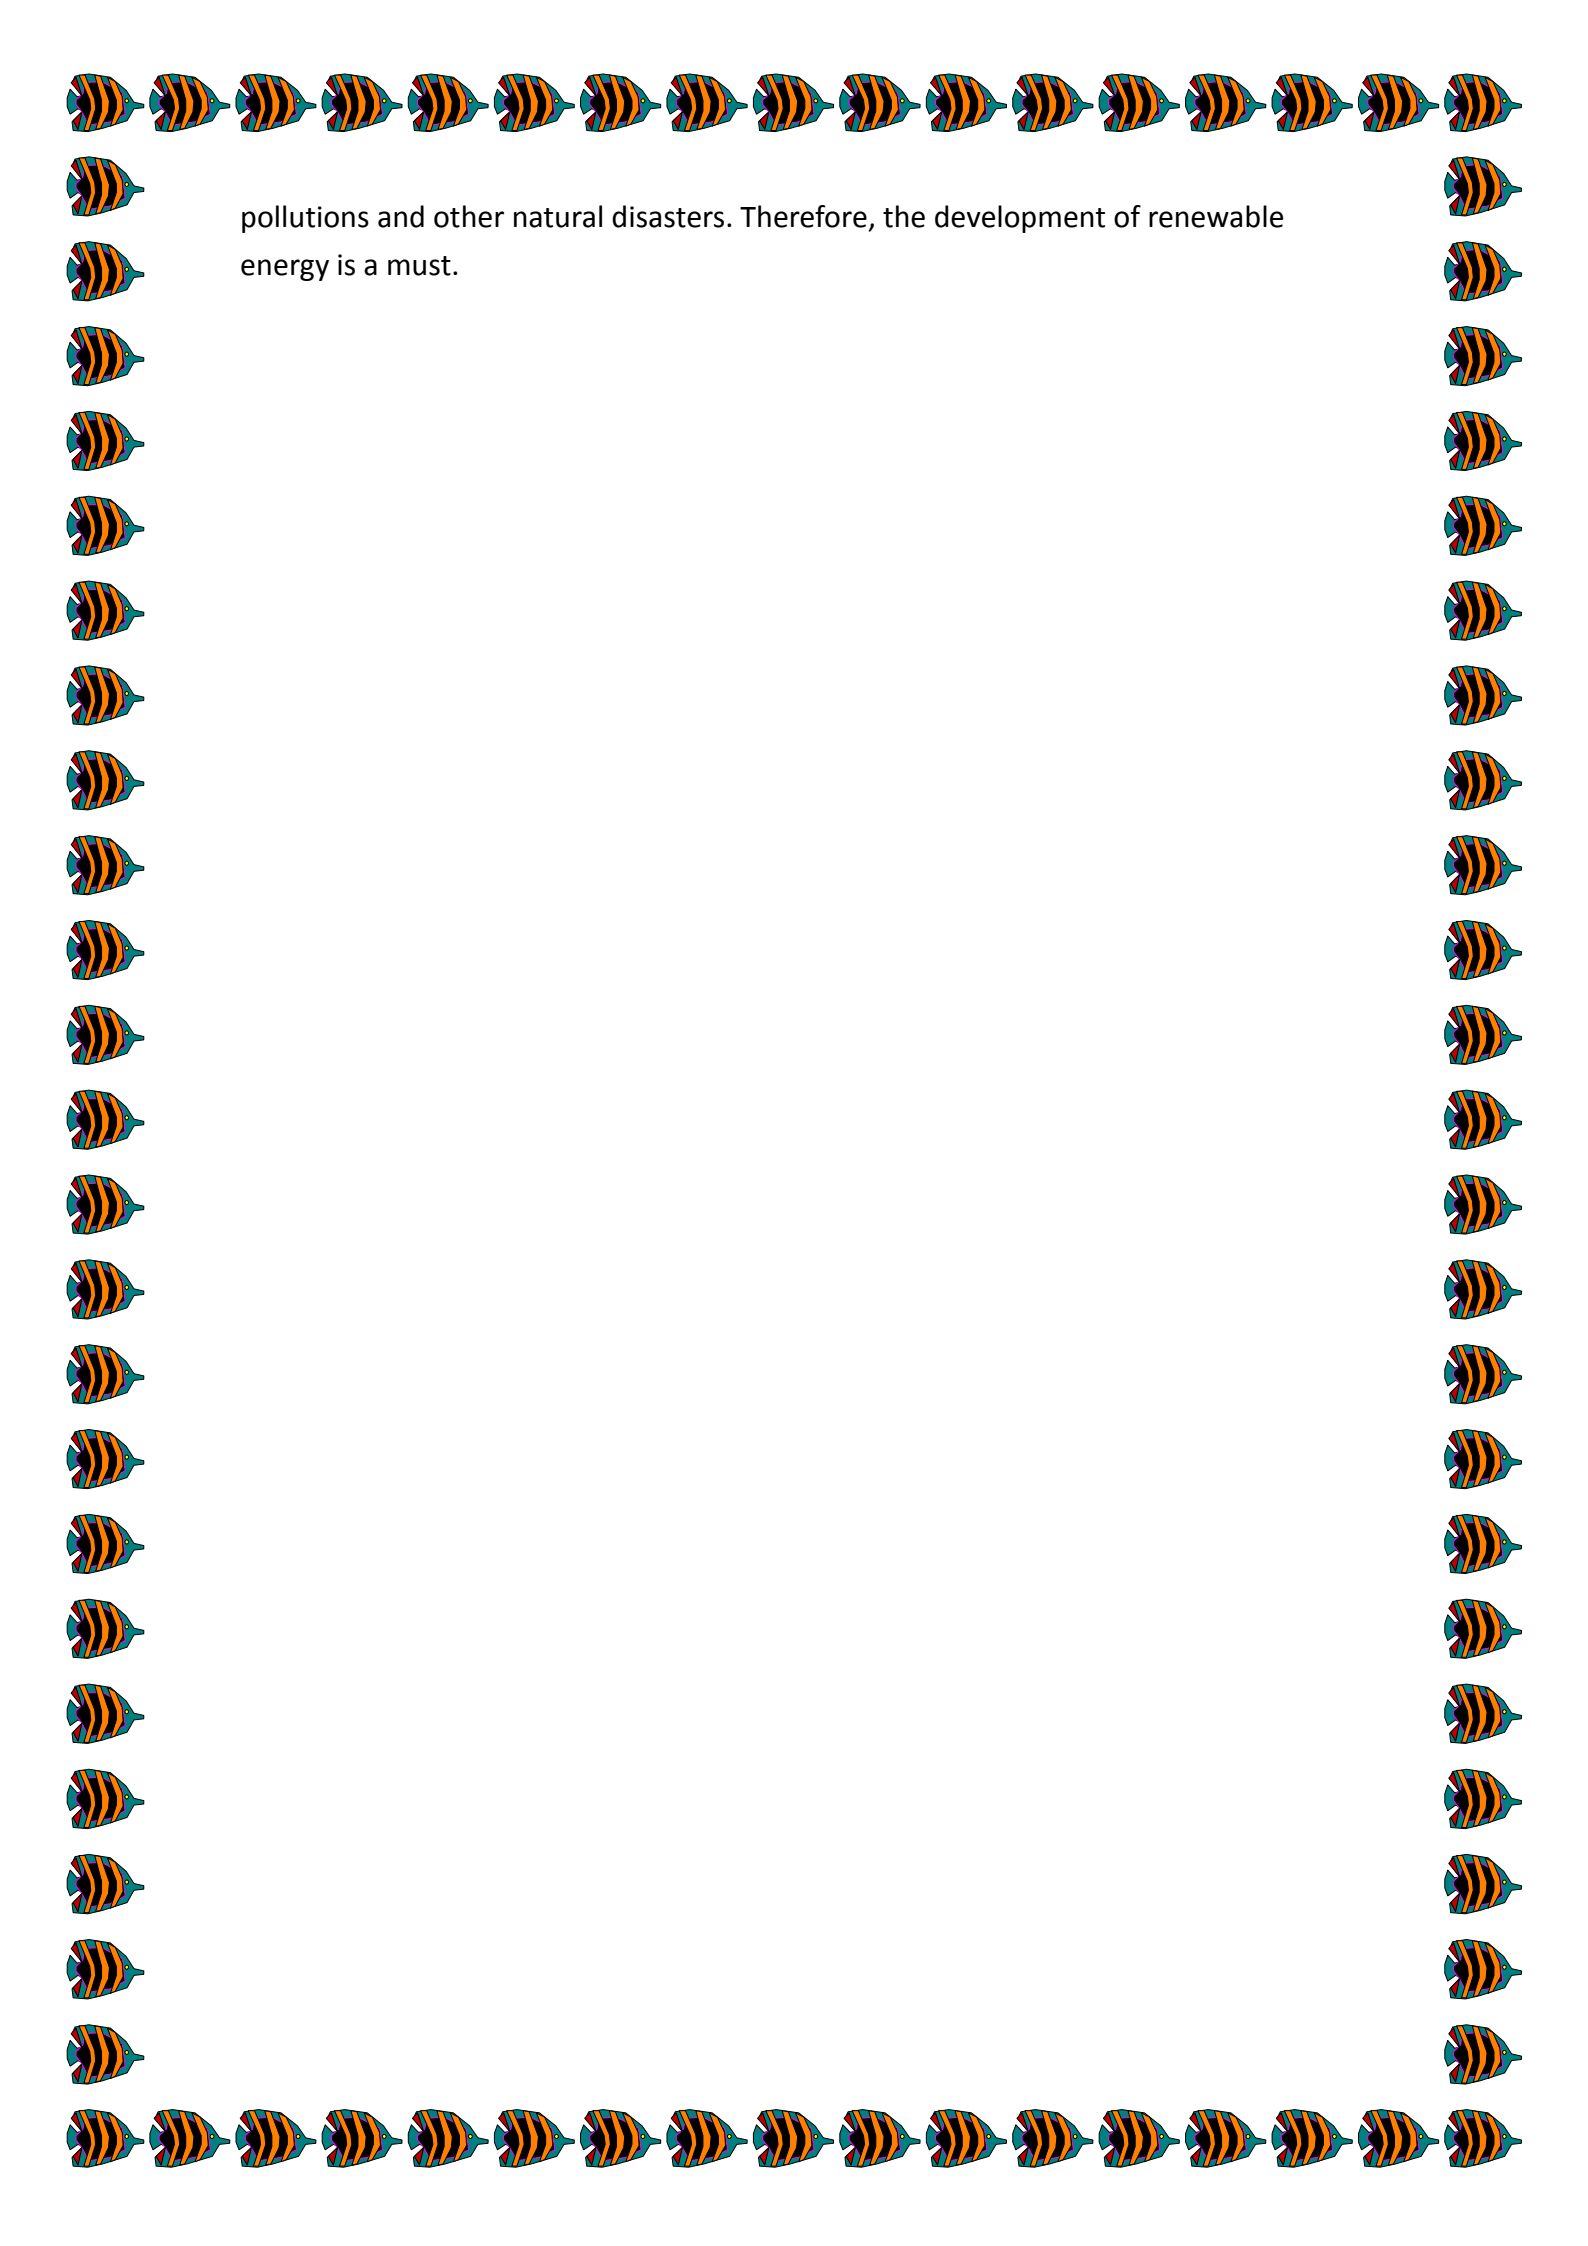

Nowadays, people concern more about our Earth. They want to protect the environment and our future. At the same time, the amount of energy that people use keeps increasing. Therefore, I strongly believe that we need to develop different renewable energy for the sustainability of our environment.

To begin with, one of the benefits of using renewable energy is that it is less harmful to the environment. If we keep using fossil fuel, it will lead to some climatic hazards such as flooding and drought. But using renewable energy can solve these problem. According to the report of Greenpeace, using renewable energy can lower the emission of greenhouse gases such as carbon dioxide, sulfur dioxide and so on. Therefore, the development of renewable energy is necessary.

The second advantage is that, when comparing the fossil fuels factories to the power plants which produce renewable energy, the latter are relatively safer. Since fossil fuels factories need to store a lot of fuel, it is dangerous as those fuels are always explosive. Thus, power plants which use renewable energy can reduce this risk. Meanwhile, the most dangerous fuel on earth is nuclear energy. If there is any accident, its side effects are extremely fatal. It will affect people's life, DNA of animals, food, plants and even the whole world.

However, it is said that the research and development cost of renewable energy is high. Some people believe that such high cost are not economically effective. I cannot agree with this statement though. Although the research and development cost of renewable energy is high, it is worth doing it because these sources of energy are good for environment and the fossil fuel problems can be solved at the same time. Since renewable energy such as solar energy, geothermal energy and wild energy is free of charge; so, if we can continuously use the renewable energy, I believe that we actually can save more money in the foreseeable future.

In conclusion, we must develop more renewable energy. It is because renewable energy is not only safer, it can also protect the environment in a more effective and efficient way. Also, we can solve a lot of problems such as global warming, air

pollutions and other natural disasters. Therefore, the development of renewable energy is a must.
